

Standardization of PQC in OpenPGP

Joint work with Stavros Kousidis (BSI), Johannes Roth (MTG AG), and Aron Wussler (Proton AG)

Dr. Falko Strenzke, MTG AG | SPIQE Workshop June 24, Munich
The work of MTG AG was carried out in the scope of Project 480 commissioned by the German Federal Office For Information Security (BSI).

OpenPGP

- ► OpenPGP Protocol
 - Public key signature and encryption
- Applications
 - ▶ E-Mail security
 - Code signing
 - ▶ File encryption
 - Backup encryption

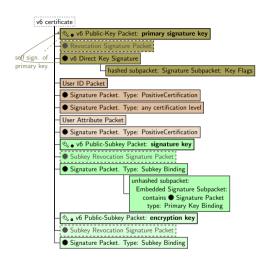

```
v6 certificate
           • v6 Public-Kev Packet: primary signature key
         Revocation Signature Packet

♦ v6 Direct Kev Signature

                    hashed subpacket: Signature Subpacket: Key Flags
       User ID Packet
        Signature Packet. Type: PositiveCertification
        * Signature Packet. Type: any certification level
        User Attribute Packet
        Signature Packet. Type: PositiveCertification
         🔾 • v6 Public-Subkey Packet: signature key
        Subkey Revocation Signature Packet
        Signature Packet. Type: Subkey Binding
                             unhashed subpacket:
                               Embedded Signature Subpacket:
                                contains Signature Packet
                                  type: Primary Key Binding
        Subkey Revocation Signature Packet
        # Signature Packet. Type: Subkey Binding
```

```
v6 certificate

    v6 Public-Key Packet: primary signature key

                                                                  self signature
           Revocation Signature Packet
                                                                   of primary key

♦ v6 Direct Kev Signature

                      hashed subpacket: Signature Subpacket: Key Flags
        User ID Packet
         Signature Packet. Type: PositiveCertification
         # Signature Packet. Type: any certification level
        User Attribute Packet
         Signature Packet. Type: PositiveCertification
         🔾 • v6 Public-Subkey Packet: signature key
         Subkey Revocation Signature Packet
         Signature Packet. Type: Subkey Binding
                                unhashed subpacket:
                                 Embedded Signature Subpacket:
                                   contains Signature Packet
                                    type: Primary Key Binding
         Q a v6 Public-Subkey Packet: encryption key
         Subkey Revocation Signature Packet
         # Signature Packet. Type: Subkey Binding
```

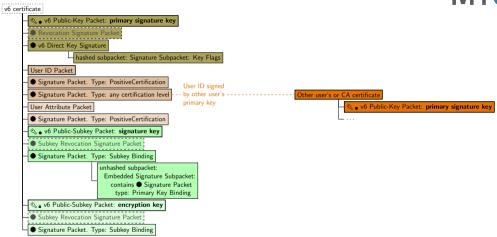

```
v6 certificate
           • v6 Public-Kev Packet: primary signature key
         Revocation Signature Packet

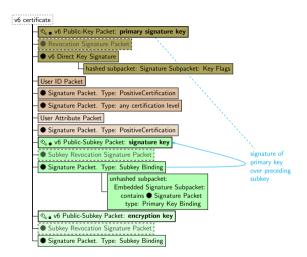

♦ v6 Direct Kev Signature

                    hashed subpacket: Signature Subpacket: Key Flags
       User ID Packet
        Signature Packet. Type: PositiveCertification
        * Signature Packet. Type: any certification level
        User Attribute Packet
        Signature Packet. Type: PositiveCertification
         🔾 • v6 Public-Subkey Packet: signature key
        Subkey Revocation Signature Packet
        Signature Packet. Type: Subkey Binding
                             unhashed subpacket:
                               Embedded Signature Subpacket:
                                contains Signature Packet
                                  type: Primary Key Binding
        Subkey Revocation Signature Packet
        # Signature Packet. Type: Subkey Binding
```

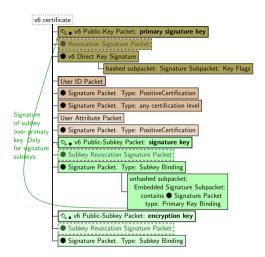

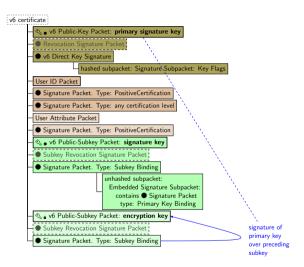

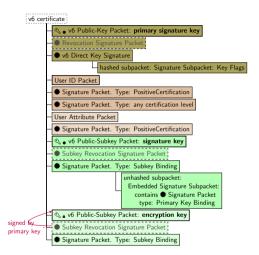

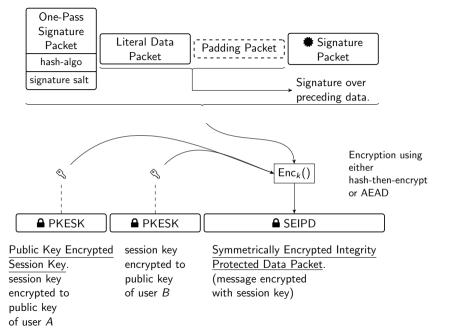

Two PQC Drafts

draft-ietf-openpgp-pqc (adopted, passed WGLC) BSI, MTG, Proton

algorithms	requ.	security
ML-KEM-768+X25519	MUST	192 / 128
ML-KEM-1024+X448	SHOULD	256 / 224
ML-DSA-65+Ed25519	MUST	192 / 128
ML-DSA-87+Ed448	SHOULD	256 / 224
SLH-DSA-SHAKE-128s	MAY	128
SLH-DSA-SHAKE-128f	MAY	128
SLH-DSA-SHAKE-256s	MAY	256

 draft-ehlen-openpgp-nist-bp-comp (not adopted)
 BSI, MTG, NIST

algorithms	security
ML-KEM-512+ECDH-NIST-P-256	128 / 128
ML-KEM-768+ECDH-NIST-P-384	192 / 192
ML-KEM-1024+ECDH- NIST-P-384	256 / 192
ML-KEM-768+ECDH-brpP256r1	192 / 128
ML-KEM-1024+ECDH-brpP384r1	256 / 192
ML-DSA-44+ECDSA-NIST-P-256	128 / 128
ML-DSA-65+ECDSA-NIST-P-384	192 / 192
ML-DSA-87+ECDSA- NIST-P-384	256 / 192
ML-DSA-65+ECDSA-brpP256r1	192 / 128
ML-DSA-87+ECDSA-brpP384r1	256 / 192
all "MAY"	

PQ/T hybrid schemes

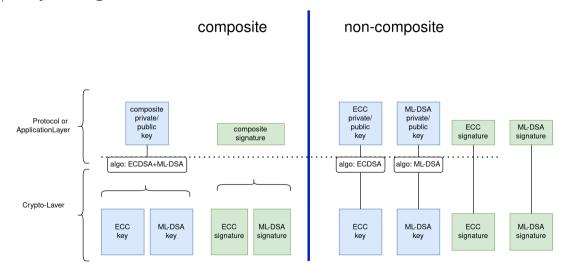

- ► European Governments recommend/require pairing PQC schemes with traditional algorithms¹
 - exception: hash-based schemes
- ▶ NIST: "new stuff sometimes gets broken"²

¹See Appendix A for references

²https://csrc.nist.gov/csrc/media/Presentations/2025/draft-sp-800-227-overview/images-media/sp-800-227-galagic.pdf#page=11, NIST's workshop for Guidance on KEMs Feb 25, 2025

PQ/T hybrid signatures

PQC integration: original idea from the project

- ▶ in any case: hybrid = "multi-algorithm" (except SLH-DSA)
- first approach: completely generic
 - New algorithm ID for ML-KEM, ML-DSA, SLH-DSA
 - Non-composite for generic combinations of algorithms
 - Multiple signatures already provided in OpenPGP
 - lacktriangle e.g. ECDH + ML-DSA specifying the respective algorithm IDs
 - and specifying the parameters:
 - ▶ ECDH with 256-bit curve 128 bit
 - ML-DSA 192 bit

Decisions for PQC integration

- ▶ Change decision 1
 - Composite
 - Algorithm ID: Fixed combinations of PQ / T
- ▶ Change decision 2
 - Set security parameters also with Algorithm ID
 - ▶ Algorithm ID = $30 \rightarrow$ "ML-DSA-65+Ed25519"

PQC signatures in OpenPGP

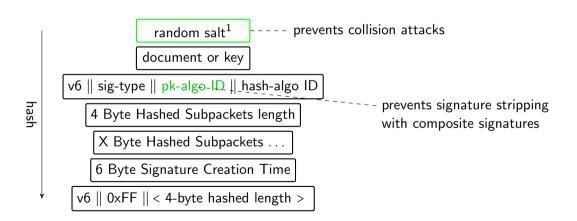

- ▶ NIST specifies pure and pre-hash (=hash-then-sign) variants
 - pure variant = internal hashing with prefix
 - hash-based: prefix = random value (randomizer)
 - ML-DSA: prefix = public-key
- OpenPGP committed to hash-then-sign
 - → use pure variant to sign the hash
 - (theoretical drawback: hash-substitution attacks)
- No use of context parameter

RFC 9580 - signatures

v6 signatures — hashed data

CMS - signatures⁴

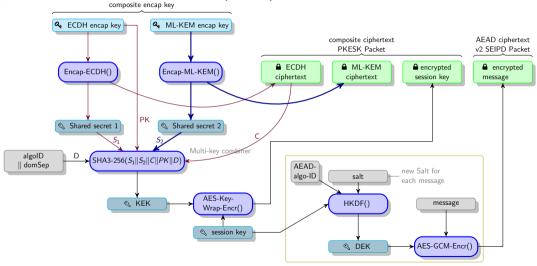

- Cryptographic Message Syntax
 - ▶ X.509 certificates
 - ▶ **#** signatures, **△** public-key encryption
- CMS legacy problem
 - F EUF-CMA problem with Signed Attributes
 - Alternative views of what was exactly signed (eprint 2023/1801³)
 - ▶ Was not solved with context parameter of new PQC algorithms
- No meta-data is hashed
 - public-key algorithm not fixed by signature
 - ▶ → in case of hybrid: signature stripping attacks require extra countermeasure
 - not fully sound if PQ-signature is stripped off and legacy signature remains
- ▶ No random salt
 - ¶ signatures potentially vulnerable to hash-collision attacks
 - ▶ even with pure variants! (due to SignedAttributes → pre-hashing)

³ slides with 2nd attack variant: https://cryptosource.de/slides/bsi-kry-sem-sig.pdf#page=30

disclaimer: none of the CMS PQC standards are final RFCs yet

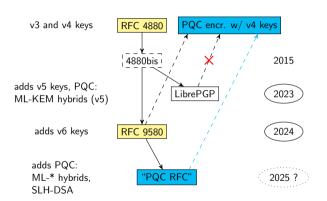

Key Encapsulation Mechanism (KEM)

RFC 9580 AEAD encryption

v6/v5/v4 PQC

- Main goal: fast adoption of PQC encryption
- GnuPG LibrePGP standard features incompatible ML-KEM hybrids
 - LibrePGP (outside IETF) is a recent fork of OpenPGP due to WG-internal unresolved technical "issues"

Private keys in seed format

- ML-DSA and ML-KEM allow expanded and seed format
- heavily discussed in LAMPS
 - ▶ decision: support for both formats due to PKCS#11/hardware compatibility issues
- OpenPGP specifies seed-only private keys
 - achieves MAL-BIND-K-PK with given KEM combiner

Performance Aspects

- ▶ Typically, OpenPGP is not performance critical (time, memory)
- ▶ SLH-DSA-256
 - ▶ small: 29KB
 - ▶ fast: 49KB
 - OpenPGP certificates carry multiple signatures
- ▶ SLH-DSA-256s signing: 1.5s @ 2GHz
 - ▶ Problem for Proton's in-browser signature generation

LAMPS WG: X.509, CMS, etc.

- Similarities:
 - Also only fixed algorithm combinations
 - Also definition of security parameters by algorithm ID
- Differences:
 - XMSS for X.509
 - ▶ LMS for X.509 & CMS
 - All 12 SLH-DSA parameters⁵
 - ML-DSA and ML-KEM as standalone
 - Composite
 - Combinations with RSA and ECDSA (NIST, Brainpool)
 - Inclusion of the Falcon signature scheme (not yet finalized by NIST)

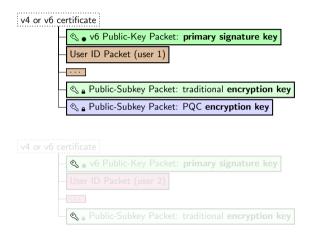

⁵SLH-DSA in LAMPS has both pure & pre-hash → 24 OIDs altogether

PQC transition

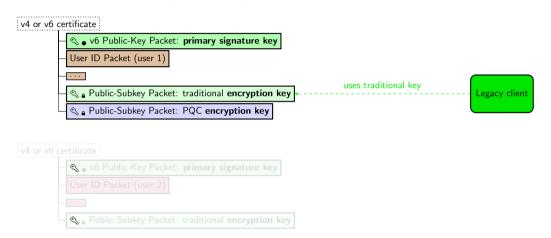

- PQC transition . . .
 - ▶ Depends (largely) on transition to v6 keys (RFC 9580)
 - ▶ No general v6 roll-out so far
 - No supporting mail client
- ▶ Typical migration: first passive support, later generate new formats

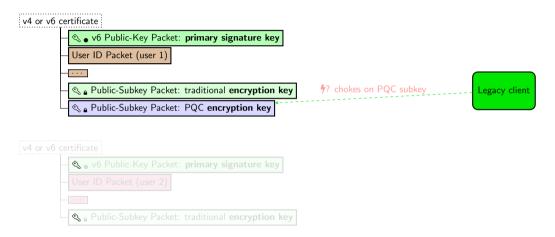

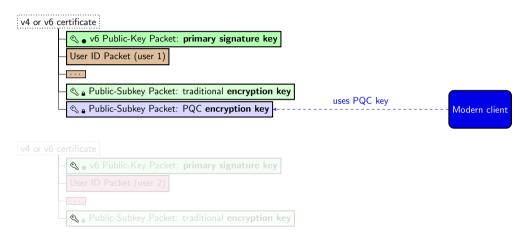

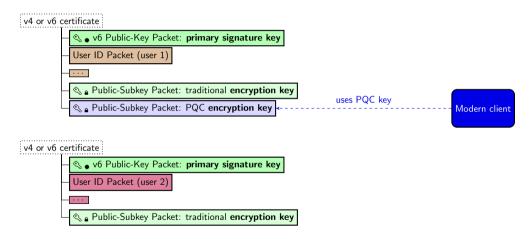

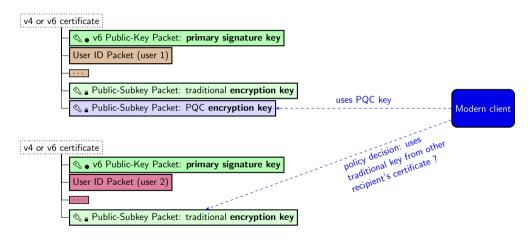

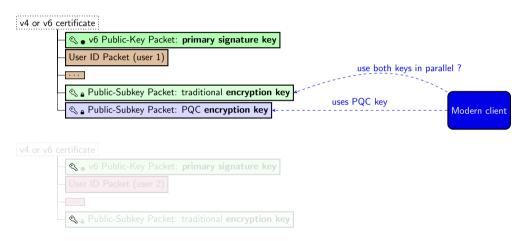

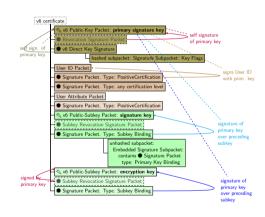

PQC transition for signature keys

- Signature:
 - Sender needs to assess whether recipient can verify PQC signatures
 - do so by checking recipient's certificate for PQC signature keys
- ▶ Potential problem:
 - PQC primary key requires recipient to understand PQC signatures
 - Only PQC signature subkey: no long-term trust in certificate

- Enable key servers to serve two certificates:
 - v4 with traditional algorithms
 - ▶ v6 with PQC
- Replacement keys signalling mechanism draft⁶

- Symmetric reencryption draft⁷
- Proton:
 - ▶ Single-step v6 + PQC transition soon for Proton users
 - Semi-open user group
 - No uncontrolled exposure of v6 or PQC keys to outsiders

https://datatracker.ietf.org/doc/draft-huigens-openpgp-persistent-symmetric-keys/02/

⁶https://datatracker.ietf.org/doc/draft-gallagher-openpgp-replacementkey/

Conclusion and Outlook

- ▶ Draft PQC for OpenPGP with current NIST spec on the way
- Unclear when large scale deployment of
 - ▶ PQC signatures and encryption with v6
 - PQC encryption-only with v4
- v6 signature features help PQC integration
- ▶ A look into the future . . .
 - ... HQC as alternative to ML-KEM
 - ... NIST's new signature call

Appendix B - RFC 9580 signature salt

- ▶ RFC 9580 signature salt sizes
 - ▶ 128 to 256 bits of random salt
 - ▶ salt size meets at least the collision resistance security level of the algorithm
